

SimplifAI

How work flows — a discussion draft

For review with the client

September 2026

This note describes how SimplifAI is meant to be used, in everyday language. It is written so we can sit with the client, walk the same story she lives (a repair, a bank file, a period that must close), and mark what should stay and what should change.

It is *not* a screenshot tutorial. There is a separate visual guide for that. This document is the story of the work. Two pictures in §3 show how the pieces relate (data) and how work moves (process).

1 What the app is for

SimplifAI is the ledger for the properties you manage. Money in and money out live in one place. Owners and properties are named. When the bank sends an Excel file, you check that the app and the bank tell the same story for that period.

The person using the app is not expected to think in software terms. She records what happened in real life, then later proves it against the bank.

2 The main loop

This is the spine of the product.

1. **Something happens in real life.** Example: the air conditioner is repaired. A bill is due. Rent arrives. A card is charged at a shop.
2. **The transaction is added to the app** as soon as it is known — usually on the **Transactions** page, by hand or from a receipt file. Owner, property, date, and amount are required.
3. **After several such rows exist**, she downloads an Excel file from the bank for that period.
4. **She uploads that Excel on Verification.** The app compares the file with what is already in the ledger.
5. **She works the lists** until every line is handled and the period totals match. Then she finishes the period.
6. **The next period starts** from the day after the last finished one. Anything still waiting (money that has not left the bank yet) comes back at the top of the new check.

That loop is the product. Everything else — dashboard, alerts, reports, credit-card list, AI — supports it.

3 How the pieces fit

Two pictures. The first is *what exists* (who, money, a period). The second is *what she does*, in order. They are drawn from the live app, in the same everyday words as the rest of this note.

3.1 Data — what belongs to what

Everything hangs off a **property**, and every property has an **owner**. Money is either an **expense** (out) or a **deposit** (in). The client's **Management expenses sheet** is that ledger on disk: one tab per property, with the money columns named in the picture. A period check does not create a second ledger; it stamps the same rows against a bank Excel file.

Figure 1: Data — who owns the property, the money columns from the Management expenses sheet, and the period check that stamps those same rows against the bank.

How to read it:

- **Owner** → **property** → **expense** / **deposit** is the ledger. Dashboard, Owners, Properties, Reports, and AI all *read* this. They do not hold a separate copy of the money.
- The money names are the columns on the **Management expenses sheet** (one tab per property). That workbook is the ground we test against.
- **Company float** (Amount, Inflow, plus MIP / Cash / Other when those columns exist) is what Verification matches to the company bank account.
- **Tracked only** (Rental income, He/She paid, owner-paid) stays in the ledger and in reports. It is not matched to the company bank.
- **Credit card** (last four, Nearly CC / Method): shop charges are still expenses on a property. They are checked on the card Excel, not as separate bank lines.
- **Bank period** is one bank Excel and the decisions on its lines, not a second ledger. **Card period** exists only if that Excel contains a card payment.
- **Holding** is Create-from-the-bank until a real owner and property are named. **Files** are the receipt column. **Next cycle** is postponed card charges (same rows). **Alerts** are reminders, not money.

In the app today. A payback is its own deposit, optionally linked to the original expense — it does not rewrite the expense. Company books (opening balance and “checked through”) live in Bank settings.

3.2 Process — how work moves

This is the same spine as later sections, drawn as a path. Blue is the weekly loop. Teal / orange / yellow are the three Excel cases. Green is a finished period. Step 6 is the gate already described later: lists handled, holding assigned, totals match.

Figure 2: Process — record what happened, prove it against the bank Excel, handle the three cases, check cards only when the bank paid the card company, then finish and start the next period.

Around that loop, the other pages do not add a second workflow:

Page	Role in the process
Dashboard, Properties, Owners, Reports, AI Query	Read the same ledger. They do not change how a period is proved.
Alerts	A work queue: unassigned rows, unmatched lines, missing deposit, low balance. Deep-links into Verification or Transactions.
Credit cards	The card register (last four digits). Used when recording “paid with card” and when a card Excel is uploaded.
Next cycle	The waiting list of postponed card charges (step 8 coming back into step 4).
Data import, Bank settings, Alert rules	Admin: load history, set opening / checked-through, set low-balance rules. Not the weekly check.

To discuss. The picture shows all four actions when the app has a row the Excel does not (Push, Keep, Merge, Ignore). If the meeting decides postpone is the only allowed action, this figure is the first thing to edit.

4 Recording a real-life transaction

4.1 Where

Transactions is the ledger. It is the page used every week, not only at month-end.

From here she can:

- add one **expense** (money out — the air-conditioner bill);
- add one **deposit** (money in — a transfer, a payback);
- attach files (receipt, invoice, photo);
- import a file (receipt PDF, generic Excel, or a statement);
- filter, edit, delete, and export CSV.

4.2 What must be filled in

For both an expense and a deposit the app requires:

- an **owner**,
- a **property**,
- a **date**,
- an **amount** greater than zero.

If those are missing, the row is not saved.

4.3 How it was paid

On an expense, **Paid with** says how the money left: company account, cash, credit card (then the last four digits of the card), and similar methods.

On a deposit, the matching idea is **Received with**. A deposit can also be marked **Rental income** or **Payback** (a refund that stays its own row, optionally linked to the original expense).

In the app today. Credit-card expenses need a card on the Credit cards page first. If none exist, the form says to add a card there before choosing one.

4.4 What this row is, until the bank is checked

A row typed by hand already has a real owner and property. Until a bank (or card) statement confirms it, the app treats it as **not yet verified** against the bank.

That is different from a row the bank invented during verification (see §8).

4.5 Money that is tracked but not “company float”

The violet box in Figure 1: **Rental income**, **He/She paid**, and **owner-paid**. They stay in the ledger and in reports. They are not what Verification matches to the company bank account.

To discuss. Confirm with the client that rental, He/She, and owner-paid stay out of the bank check, as they do today.

5 Checking a period against the bank

5.1 When

When she has a bank Excel for the period — typically after several transactions are already in the app.

Page: **Verification**.

The top of the page shows:

- **Bank balance** — opening, or the closing of the last finished period;
- **Checked through** — the last day already finished;
- **Still to check** — rows still waiting.

She uploads the bank Excel under **Step 1 • Bank statement**.

If that file has already been fully checked, the app says she is caught up — there are no new bank lines.

5.2 What the upload is asking

For every movement on the Excel, and every company-float row in the app for that window, the period must end in one of three places:

1. it is in **both** the app and the Excel;
2. it is in the **app but not** the Excel;
3. it is in the **Excel but not** the app.

The identity she is proving is:

$$\text{Opening balance} + \text{money in the app for this period} = \text{closing balance on the statement.}$$

She cannot finish while that is off by more than one agora (ILS 0.01), or while any list item is still open, or while a bank-created row is still sitting on **Needs assignment**.

6 Case 1 — the transaction is in the app and in the Excel

This is the happy path.

Example: the air-conditioner expense was typed last week. The bank Excel shows the same amount leaving the account.

The app puts it under **Found on statement**.

What she does:

- **Confirm** that one row, or
- **Confirm all found**.

After confirm, that row is bank-verified. It counts in this period's totals.

If the amounts are close but not the same, she can **Merge**: the bank date, amount, and reference (*asmachta*) win, and the app row is updated to match the bank.

7 Case 2 — the transaction is in the app, not in the Excel

The ledger already knows about the money. The bank file for *this* period does not show it leaving (or arriving).

Typical reason: the work was done, the row was typed, but the bank has not paid yet — it will show on the *next* statement.

7.1 What we want

Postpone it to the next period. When the next bank Excel arrives, match it to the bank line.

7.2 What the app does today

Those rows appear under **In the app, not on the statement** (and, for some card leftovers, under **Not for this period**).

Actions available:

Push to next cycle

The intended postpone. The row waits. It is listed on **Next cycle**. When the next verification starts, it is shown again so it can be matched to the bank (Merge / Confirm) if the money has now left.

Keep in this period

She decides it belongs in *this* cycle even though it is not on this Excel (for example a card charge that should count now).

Merge

It is actually the same as a bank line that did not auto-match (wrong date or wording). Bank values overwrite the app row.

Ignore

Leave it out of this check, with a reason.

To discuss. The original story only named postpone. The app also offers Keep, Merge, and Ignore. Decide with the client whether postpone should be the only action for “in the app, not on the Excel”, or whether Keep / Merge / Ignore should stay.

8 Case 3 — the transaction is in the Excel, not in the app

The bank shows money that was never typed.

Typical reasons: someone paid from the account and forgot to record it; or the row was never imported.

8.1 What we want

Create the missing transaction. It must not pretend to be a finished, assigned row. Owner and property start as a holding bucket. Those rows must be given a real owner and property before the period can finish.

8.2 What the app does today

Those bank lines appear under **On the statement, not in the app**.

Actions:

Create

Makes the deposit or expense from the bank line. Owner is **Needs assignment**. Property is **UNASSIGNED**. The row is flagged for handling. An alert is raised until it is assigned.

Create payback

Same idea, for a bank credit that is a refund / partial return.

Merge

Link this bank line to an existing app row that is the same transaction (bank values win).

Ignore

Do not create it; give a reason.

After Create she uses **Edit** on that row: pick the real owner and property, section, paid-with, notes, files.

In the app today. The holding names in the app are **Needs assignment** (owner) and **UNASSIGNED** (property) — not the phrase “unverified transaction”. A row she typed herself with a real property is simply unverified until the bank confirms it. A row the bank created is *unassigned* until she names it.

To discuss. If the client prefers the words “unverified transaction” on that holding owner/property, that is a label change we can make. The rule itself already matches: create from the bank, then assign before the period can end.

9 Finishing the period

Finish period stays off until all of the following are true:

1. every bank line is confirmed, created, merged, or ignored;
2. every leftover app row is merged, postponed, kept, or ignored;

3. no bank-created row is still on Needs assignment / UNASSIGNED;
4. opening + app net = closing, within ILS 0.01.

If the totals are off, the app says the period is off by ILS X and asks her to create a transaction for that amount.

Finished periods stay on Verification as history (**Finished periods**), with a badge for totals match or totals off. They are view-only.

To discuss. Finish-only-when-balanced is strict on purpose. Confirm she wants no “finish anyway”.

10 Credit cards

Cards sit *under* verification, not as a separate monthly ritual.

10.1 When cards are required

If the bank Excel contains a card payment (the Mastercard / card-settlement line), Step 2 **Credit card** appears: “Your bank statement includes a card payment — upload that card statement next.”

She uploads each card’s Excel, confirms matches, creates missing card charges, or postpones charges that are not on this card file.

10.2 When cards are ignored

If the bank Excel has *no* card payment, the app says: “No card payment on this statement — no card check needed.” She does not upload card files for that period.

10.3 The two layers

1. **Card statement** — each shop charge (the air-conditioner paid by card) is matched to the card Excel.
2. **Bank statement** — the lump sum the bank paid the card company is the settlement line. Confirm it once the card side is in order. Individual shop charges are not re-matched one-by-one to the company bank account, unless they were postponed and the money later leaves the bank as its own debit.

10.4 Cards as a list

Credit cards is a small register: last four digits, optional name, active / inactive, view that card’s transactions. Cards are also created automatically when a new card statement is uploaded.

10.5 Next cycle

Next cycle lists card charges that were pushed forward (“after this date”). They reappear at the top of Verification when the next statement is opened, so they can be kept, pushed again, or matched to the bank.

To discuss. Confirm the rule: card step only when the bank file shows a card payment; otherwise skip cards for that period. That is how the app works now.

11 A picture of one period

In real life	In the app	On the bank Excel
AC repaired, paid from the company account	Expense typed on Transactions	Same debit → Found → Confirm
AC repaired, typed, bank has not paid yet	Expense already in the ledger	Missing → Push to next cycle
Someone paid from the account, never typed	Nothing yet	Create → Needs assignment → assign before finish
Shop charge on the company card	Expense paid with card	Card Excel in Step 2; bank only shows the card payment lump

12 The rest of the app

These pages are not the main loop. They make the loop usable.

12.1 Dashboard

The overview for a month, quarter, or year: deposits, expenses, net, open alerts, property health, recent activity. Jumps into Transactions or Alerts.

12.2 Properties

The property list: owner, incoming, outgoing, balance, active / inactive. Incoming here is company float (not rental). Outgoing excludes He/She and owner-paid. Opens that property's transactions.

12.3 Owners

The same idea rolled up by owner. Inactive means every linked property is inactive.

12.4 Alerts

Things that still need a person:

- missing expected deposit;
- incomplete import (missing date or amount);
- needs assignment (UNASSIGNED rows);
- unmatched bank / unmatched app / gap, while a period is open;
- unmatched card lines;
- low balance (threshold set by an admin).

Reconcile alerts deep-link to Verification. Assignment alerts can open Transactions or Verification.

12.5 Reports

Simple totals by owner or by property. Links back to Owners / Properties.

12.6 AI Query

Ask in plain language (“electricity this quarter”). Opens matching rows in Transactions or exports Excel.

12.7 Data import

(admin)

Load the client’s workbooks (client list + Management expenses sheet) into the database. Can reset the database first. This is how a full history is brought in — not the weekly bank check.

12.8 Bank settings

(admin)

Opening balance, the date the books start, “bank verified through”, and how tight the gap may be. A cutover can mark everything up to a date as already verified.

12.9 Alert rules

(admin)

Low-balance threshold, globally or per property.

12.10 Feedback

Any page: send a problem or an idea by email.

13 Words we use

Everyday / client wording	Label in the app today
The ledger	Transactions
Check the period against the bank	Verification
In both app and Excel	Found on statement
In the app, not on this Excel	In the app, not on the statement
On the Excel, not in the app	On the statement, not in the app
Postpone until the bank pays	Push to next cycle
Count it in this period anyway	Keep in this period
Same transaction, fix the app from the bank	Merge
Bank created a row we have not named	Needs assignment / UNASSIGNED
Typed row, bank has not confirmed it yet	Unverified
Card shop charge waiting for a later file	Next cycle / Credit card postponed
Company running total	Inflow / Expenses / Balance (excludes rental and He/She)

14 Suggested agenda with the client

Walk these in order, with the live app open:

1. Tell the air-conditioner story once, without the screen.
2. Add that expense on Transactions (owner, property, date, amount, paid with).
3. Open Verification and upload a bank Excel.
4. Point at the three lists. Do one Confirm, one Push, one Create.
5. Assign the created row off Needs assignment.
6. Show Finish blocked while the gap is off, then matching totals.
7. Show a statement *with* a card payment (Step 2 appears) and one *without* (“no card check needed”).
8. Open Next cycle and Alerts so she sees leftovers and assignment warnings.

Then decide, in writing:

- Is postpone the only action when the app has a row the Excel does not? (Today: Push, Keep, Merge, Ignore.)
- Are the holding names “Needs assignment / UNASSIGNED” acceptable, or should they read “unverified transaction”?
- Must every period close at ILS 0.00, with no finish-anyway?
- Do rental, He/She, and owner-paid stay off the bank check?
- Is the card step only when the bank file shows a card payment?

This draft follows the app as it behaves in September 2026. Edit the yellow boxes after the meeting; they are the change list.
